

What are the dimensions of the change you're working towards?

Whether it's a personal new year's resolution or a global issue you want to have resolved, have you considered the *different dimensions* of the change that you want to see in the world?

1. Are there **technological inventions** required to deliver the change you want to happen, or is all the necessary technology in place?

*For instance, Leonardo da Vinci dreamed of helicopters, but the technology wasn't available. In environmental sustainability, we actually have all the inventions we need to deliver **global cooling** within this current century.*

2. Are there **technologies** required to support the **adoption** of the change you want to happen?

For instance, Galileo delivered a better telescope that enabled astronomers to observe for themselves that the earth circled the sun. He also shared how to make a better telescope. Explainer videos on the Internet can spread an idea without you leaving home.

3. What are the **human** issues around **inventing** the change you want to happen?

To solve complicated problems, different professions have developed group problem solving processes that require the expertise of more than one person. Integrative Design is enabling the invention of super-efficient buildings. Agile projects are delivering better computer systems.

4. What are the **human** issues around the **adoption** of the change you want to happen?

Who will support and resist the change you are working towards? What new practices and habits will you need to build to have your change adopted?
